Model Training Best Fit - Achievers

Model Training Best Fit - Completers

Model Training Best Fit - Leavers

Model Fit (nRMSE)

Lower = better

Achievers

Model Trend	nRMSE
add - Damped	0.2654
mul - Not Damped	0.2655
add - Not Damped	0.2765
mul - Damped	1.1555

Completers

Model Trend	nRMSE
add - Damped	0.0884
add - Not Damped	0.0928
mul - Not Damped	0.3420
mul - Damped	0.3788

Leavers

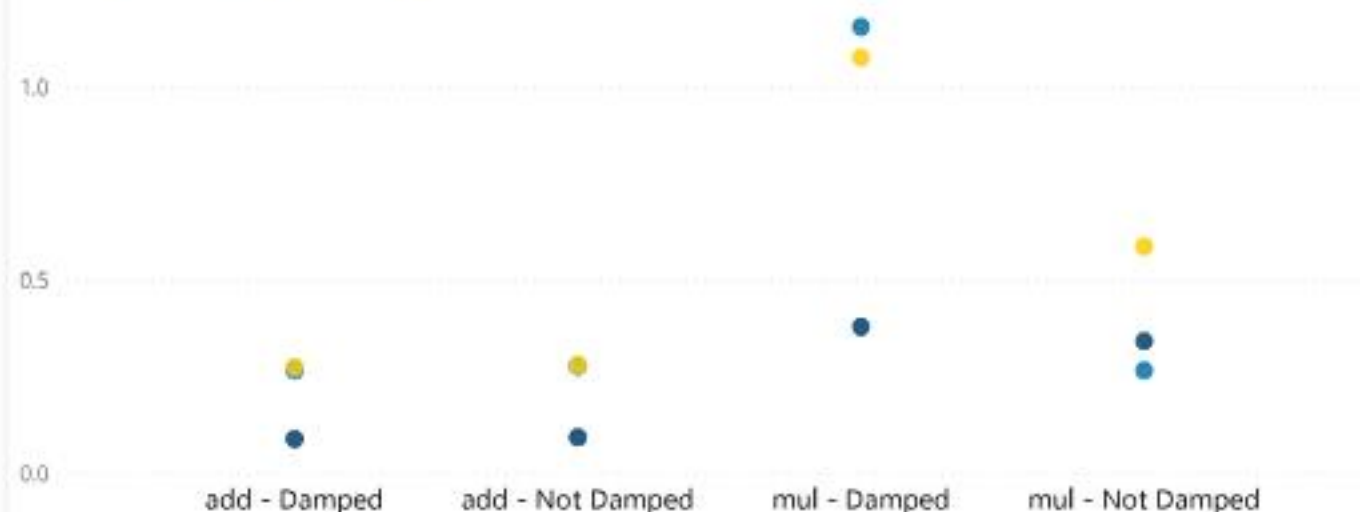

Model Trend	nRMSE
add - Damped	0.2754
add - Not Damped	0.2804
mul - Not Damped	0.5870
mul - Damped	1.0761

Add-damped Holt-Winters achieved the lowest nRMSE for all three KPIs; forecast assumes no seasonality and six-year historical window.

What is "damped"? A damped Holt-Winters model still applies an additive trend, but multiplies it by a damping factor ($\phi < 1$) each step so future growth gradually flattens instead of growing indefinitely.

Model Error Comparison

Series: Achievers (blue), Completers (dark blue), Leavers (yellow)

QAR Forecast vs 2024/25

1.01%

Forecast based on six historical years; no seasonality; additive-damped trend.

Forecast suggests QAR rises by 1 pp to 33 %. Largest driver is 4 fewer leavers; retention flat.

Achiever Adjust %

0.00

0 % (middle) - Here's our best-estimate forecast.

+5 % (drag right) - If we can improve completions by 5 %, QAR improves by about 1.6 pp.

-10 % (drag left) - Losing 10 % of achievers would push QAR down below target.
